Why is SAP using Static Code Analysis?
Secure Development Lifecycle at SAP
Static Code Analysis at SAP
Challenges and Outlook
Costs of Computer Hacks

- TJX Company, Inc. (2007) $250 million
- Sony (2011) $170 million
- Heartland Payment Systems (2009) $41 million

“A hack not only costs a company money, but also its reputation and the trust of its customers. It can take years and millions of dollars to repair the damage that a single computer hack inflicts.”

(http://financialedge.investopedia.com/financial-edge/0711/Most-Costly-Computer-Hacks-Of-All-Time.aspx)
Has Sony been Hacked this Week?
http://hassonybeenhackedthisweek.com/

Time-line of the Sony Hack(s) (excerpt):

- 2011-04-20  Sony PSN goes down
- 2011-05-21  Sony BMG: data of 8300 users leaked (SQL Injection)
- 2011-05-23  Sony Japanese database leaked (SQL Injection)
- 2011-05-24  Sony Canada: roughly 2,000 leaked (SQL Injection)
- 2011-06-05  Sony Pictures Russia (SQL Injection)
- 2011-06-06  Sony Portugal: SQL injection, iFrame injection and XSS
- 2011-06-20  20th breach within 2 months,
  177k email addresses were grabbed via a SQL injection
  (http://hassonybeenhackedthisweek.com/history)
A Bluffers Guide to SQL Injection

Assume an SQL Statement for

```
statement = "SELECT * FROM 'users' WHERE 'name' = '' + userName + '';"
```

What happens if we choose the following (weird) `userName`:

```
userName = '' or '1'=1"
```

Resulting in the following statement:

```
statement = "SELECT * FROM 'users' WHERE 'name' = '' or '1'=1;"
```

Which is equivalent to

```
statement = "SELECT * FROM 'users';"
```

And selects the information about all users stored in the table `users`
Insecure Software

Vulnerability Disclosures Growth by Year
1996-2011

Evolution of Code

Code Metrics Overview
(ABAP Code Metrics only)

Select Product: SAP CRM

Change View: Chart Table

Select Code Metric:
- Lines of Code
- Lines of Comment
- Number of Objects
- Number of Statements

Security Testing

Find Vulnerabilities Using the Running Application:
- Manual Application Penetration Testing
- Automated Application Vulnerability Scanning

Find Vulnerabilities Using the Source Code:
- Automated Static Code Analysis
Dynamic Security Testing

Characteristics
• Black box approach
• Sends input to applications and analyses response

Advantages
• Provides concrete examples (attacks)
• Analyze dataflows across multiple components

Disadvantages
• Coverage unclear
• Requires test system
Static Security Testing

Characteristics
- White box approach
- Analyses abstraction of the source (binary)

Advantages
- Explores all data paths / control flows
- Can analyze single modules (unit test)

Disadvantages
- High false positive rate (not exploitable findings)
- Does not consider application environment
Security Code Scans at SAP: Overview

Started rollout in June 2010

Centrally guided by a project team
  • Definition of Security Requirements
  • Establishment of Scan Infrastructure

Support of the most important languages

SAP development and third party code
Agenda

Why is SAP using Static Code Analysis?

Secure Development Lifecycle at SAP

Static Code Analysis at SAP

Challenges and Outlook
First Step: Security Training

Education
• The prerequisite for achieving a high security quality

Security awareness
• Reducing the number of “built-in” security problems

Trained persons
• Analyze and fix vulnerabilities much more efficiently

Trainings
• Secure Programming, Build & Scan, Auditing, ….
Secure Development Lifecycle (SDLC) at SAP

Structure the investment of time and resources

• to safeguard a high level of security
• to ensure security standards across all areas

Security requirements

• are taken into account and
• are implemented

in all phases of product development
The Different Roles

**Developer**
- fixes software security issues

**Security Expert**
- review scan results, decides on fixes

**Build Master**
- scans the source code, manages results

**Scrum Master**
- requests scan, assigns vulnerabilities to developers
Infrastructure
For passing D2P Q-gate, evidence has to be provided that the source code has been scanned and exploitables have been fixed.

P2D: Planning to Development. / D2P: Development to Production. /

P2R: Production to Ramp-up (gradual roll-out to customers).
Third Party Code

Third party code
• Open Source libraries and frameworks
• Freeware
• other third party components

Different approaches
• SAST analysis by SAP
• Trusted (certified) vendors
• Certificate from trusted third party (e.g., based on binary analysis)
• SLA with vendor
Agenda

Why is SAP using Static Code Analysis?
Secure Development Lifecycle at SAP
Static Code Analysis at SAP
Challenges and Outlook
Code Scan Facts

Over 2000 developers are using SAST tools

Over 500 MLOC scanned

Statistics Jan 2012
Security Scan Tools used at SAP

<table>

<td>HP/Fortify</td>
</tr>
</tbody>
</table>
Security Requirements

SAP on Corporate Security Requirements

• SAP Applications shall be free of backdoors
• SQL injection vulnerabilities shall be avoided
• Cross-Site Scripting vulnerabilities shall be prevented
• Directory traversal vulnerabilities shall be prevented
• The system shall be protected against buffer overflow vulnerabilities

OWASP Top 10

CWE/SANS Top 25 2011

CVE
Continuous Improvement

Collect feedback from the
• Product Security Response Team
• Development Teams

Develop rules/models to improve the scans

Continuously improve the infrastructure

Continuously improve the rollout process
Input to Improve Code Scans

Further input channels:
Development teams, internal research, scan reviews, code reviews
Lessons Learned

Scans have to be obligatory
  • **but not** introduced ‘brute force’

Establish Secure Development Life Cycle
  • make scans a natural part of development

Plan carefully
  • Do not start with scans right before Dev. Close
  • Do it regularly (nightly)
  • Do regression testing of new versions of the used tools
  • Do continuously discuss new threats with the security community

Do not introduce changes during development
Agenda

Why is SAP using Static Code Analysis?
Secure Development Lifecycle at SAP
Static Code Analysis at SAP
Challenges and Outlook
Challenges
JavaScript I
Unerstand the DOM

Assume the following (simplified) index.html:

```
<TITLE>Welcome!</TITLE>
   Hi
   <SCRIPT>
     var pos=document.URL.indexOf("name=")+5;
     document.write(document.URL.substring
                      (pos,document.URL.length));
   </SCRIPT>
   Welcome to our system
```

And a call

```
index.html?name=<script>alert(document.cookie)</script>
```

Resulting in a DOM-based XSS attack

**Warning:** DOM implementations are Browser specific
A simple script tag:

```html
<script language="javascript">
    document.write("<script src='other.js'></script>");
</script>
```

Dynamic creation of script tags

```javascript
var oHead = document.getElementsByTagName('HEAD').item(0);
var oScript = document.createElement("script");
oScript.type = "text/javascript";
oScript.src = "other.js";
oHead.appendChild(oScript);
```

Or using eval() directly (not shown here)
JavaScript II  
Dynamic Evaluation

A simple script tag:

```html
<script language="javascript">
    document.write("<script src='other.js'></script>";
</script>
```

Dynamic creation of script tags

```javascript
var oHead = document.getElementsByTagName('HEAD').item(0);
var oScript = document.createElement("script");
oScript.type = "text/javascript";
oScript.src = "other.js";
oHead.appendChild(oScript);
```

Or using eval() directly (not shown here)
Combining the complexity of both worlds:

```javascript
var entry = JSON.parse(data);
query = "insert into \"FOO\".".NAME\")\";\";
var conn = $.db.getConnection();
conn.execute(query);
```
Challenges: Current Trends

“You cannot pay people well enough, to do proper code audits. I tried it.”
Yaron Minsky, Jane Street Capital

SAST works very well for
• “traditional” programming languages
• Analyzing data paths within one technology

Many new development uses JavaScript
• HTML5 / JavaScript UIs
• Server-side JavaScript

JavaScript
• Untyped / dynamically typed
• Dynamic programming model
Thank you
